AB Implants are used in combination with an anti-scarring agent in order to
inhibit scarring that may otherwise occur when the implant is placed
within an animal. The agent may be any suitable anti-scarring agent,
e.g., a cell cycle inhibitor, and may be used in conjunction with a
second pharmaceutical agent, e.g., an antibiotic. Suitable implants
include intravascular implants, a vascular graft or wrap implant, an
implant for hemodialysis access, an implant that provides an anastomotic
connection, ventricular assist implant, a prosthetic heart valve
implant, an inferior vena cava filter implant, a peritoneal dialysis
catheter implant, a central nervous system shunt, an intraocular lens,
an implant for glaucoma drainage, a penile implant, an endotracheal
tube, a tracheostomy tube, a gastrointestinal device, and a spinal
implant.

AB Intravascular devices (e.g., stents, stent grafts, covered stents, aneurysm coils, embolic agents and drug delivery catheters and balloons) are used in combination with fibrosing agents in order to induce fibrosis that may otherwise not occur when the implant is placed within an animal or to promote fibrosis between the devices and the host tissues. Compositions and methods are described for use in the treatment of aneurysms and unstable arterial (vulnerable) plaque.

AB Intravascular devices (e.g., stents, stent grafts, covered stents,
aneurysm coils, embolic agents and drug delivery catheters and balloons)
are used in combination with fibrosing agents in order to induce
fibrosis that may otherwise not occur when the implant is placed within
an animal or to promote fibrosis between the devices and the host
tissues. Compositions and methods are described for use in the treatment
of aneurysms and unstable arterial (vulnerable) plaque.

AB A marking material that, when disposed upon medical devices used during
interventional medical procedures with imaging modalities such as X-ray
Fluoroscopy and Magnetic Resonance Imaging, renders such medical devices
visible with minimal imaging artifacts. The material comprises a
particulate material with generally higher atomic weight disposed within
a matrix material with generally lower atomic weight. In one embodiment
the particulate material is magnetic. In another embodiment the
particulate material is non-magnetic.

AB Medical devices, and in particular **implantable** medical
devices, may be **coated** to minimize or substantially eliminate
a biological organism's reaction to the introduction of the
medical device to the organism. The medical devices
may be **coated** with any number of biocompatible materials.
Therapeutic drugs, agents or compounds may be mixed with the
biocompatible materials and affixed to at least a portion of the
medical device. These therapeutic drugs, agents or
compounds may also further reduce a biological organism's reaction to
the introduction of the **medical device** to the
organism. In addition, these therapeutic drugs, agents and/or compounds
may be utilized to promote healing, including the formation of blood
clots. The drugs, agents, and/or compounds may also be utilized to treat
specific diseases, including vulnerable plaque. Therapeutic agents may

also be delivered to the region of a disease site. In regional delivery, liquid formulations may be desirable to increase the efficacy and deliverability of the particular drug. Also, the devices may be modified to promote endothelialization. Various materials and **coating** methodologies may be utilized to maintain the drugs, agents or compounds on the **medical device** until delivered and positioned. In addition, the devices utilized to deliver the **implantable** medical devices may be modified to reduce the potential for damaging the **implantable medical device** during deployment. Medical devices include stents, grafts, anastomotic devices, perivascular wraps, sutures and staples. In addition, various polymer combinations as well as other therapeutic agents may be utilized to control the elution rates of the therapeutic drugs, agents and/or compounds from the **implantable** medical devices. In each of these instances, antioxidants are utilized to prolong product integrity.

AB A therapeutic assembly that contains a therapeutic agent, a cytotoxic
radioactive material, and a nanomagnetic material with nanomagnetic
particles. The nanomagnetic particles have an average particle size of
less than about 100 nanometers; and the average coherence length between
adjacent nanomagnetic particles is less than 100 nanometers. The
nanomagnetic material has a saturation magnetization of from about 2 to
about 3000 electromagnetic units per cubic centimeter, a phase
transition temperature of from about 40 to about 200 degrees Celsius,
and a saturation magnetization of from about 2 to about 3,000
electromagnetic units per cubic centimeter

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention has several plausible embodiments. In one
embodiment an apparatus for **coating a medical**

device is provided. This apparatus includes a **coating** chamber, a vibrating structure within the **coating** chamber the vibrating structure capable of suspending a **medical device** positioned in the **coating** chamber, and a **coating** source, the **coating** source positioned to introduce **coating** into the **coating** chamber. In another embodiment a method of **coating** a **medical device** is provided. This method includes moving a **medical device** into a predetermined **coating** area, vibrating a structure below the **medical device**, the vibration of the structure forcing the **medical device** away from the vibrating structure, and **coating** at least a portion of the **medical device** that has moved away from the vibrating structure.

AB The present invention relates to fiber compositions comprising gels or hydrogels. The invention further relates to the composition of a gel or hydrogel loaded **biodegradable** fiber and methods of fabricating such fibers. The present invention further provides tissue engineering and **drug-delivery** compositions and methods wherein three-dimensional matrices for growing cells are prepared for in vitro and in vivo use. The invention also relates to methods of manipulating the rate of therapeutic agent release by changing both the **biodegradable** polymer properties as well as altering the properties of the incorporated gel or hydrogel.

AB The invention relates to compositions and methods for delivering a polyionic bioactive composition such as a nucleic acid to a tissue of an animal. The compositions of the invention include compositions which comprise a matrix comprising the polyionic bioactive agent and wherein

at least most of the polyionic bioactive agent at the exterior portion of the matrix is present in a condensed form. The invention also includes methods of making such compositions, including particles, devices, bulk materials, and other objects which comprise, consist of, or are **coated** with such compositions. Methods of delivering a polyionic bioactive agent to an animal tissue are also described. The invention further includes a method of storing a nucleic acid.

U.S. Appln. S.N. 10/069,785
AMENDMENT

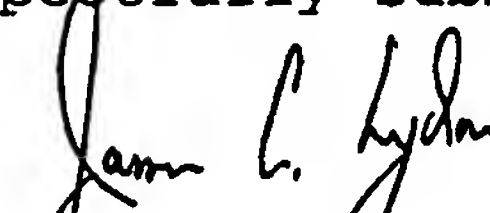

PATENT

rejection of claims 33 and 34 over Tuch in combination with McPherson et al. are earnestly requested.

It is believed this application is in condition for allowance. Reconsideration and withdrawal of all rejections of claims 18-34, and issuance of a Notice of Allowance directed to those claims, are earnestly requested. The Examiner is urged to telephone the undersigned should he believe any further action is required for allowance.

It is not believed any fee is required for entry and consideration of this Amendment. Nevertheless, the Commissioner is authorized to charge our Deposit Account No. 50-1258 in the amount of any such required fee.

Respectfully submitted,

James C. Lydon
